

## PUMPING SOLUTIONS FOR SHUT-IN AND DUC WELLS

As market conditions force operators to shut in their wells, Axis Energy Services is prepared to be a partner of support for our customers who have drilled-but-uncompleted (DUC) wells and/ or producing wells that need to be shut in.

If wells are going to be shut in for an extended period of time, they will need to be treated to protect the casing and downhole equipment integrity. That is where Axis comes in with our high-pressure pumping units.

We have years of experience in treating both DUC and producing wells using a variety of chemical treatment options specific to customer needs and well-specific requirements in order to protect your downhole casing and equipment. Our experienced pressure pumping crews will treat all wells with the precise chemical treatment option needed to protect the well until the producer is ready to reopen it. We are able to bullhead these wells from the surface or circulate around with an Axis workover rig and pump package.

Any Axis pumping unit can be used in this process, depending on where the well is located. We can work in every basin, so contact your local Axis representative if you are in need of this valuable and cost effective service.
